Implementation Strategies to Reduce Alcohol-Impaired Motor Vehicle Crashes in Tennessee

PI: Dr. Sabya Mishra; GA: Veera Nagamanickam

Center for Transportation Innovations in Education and Research

Alcohol-impaired driving is a critical public safety concern, contributing to a significant number of fatalities annually.

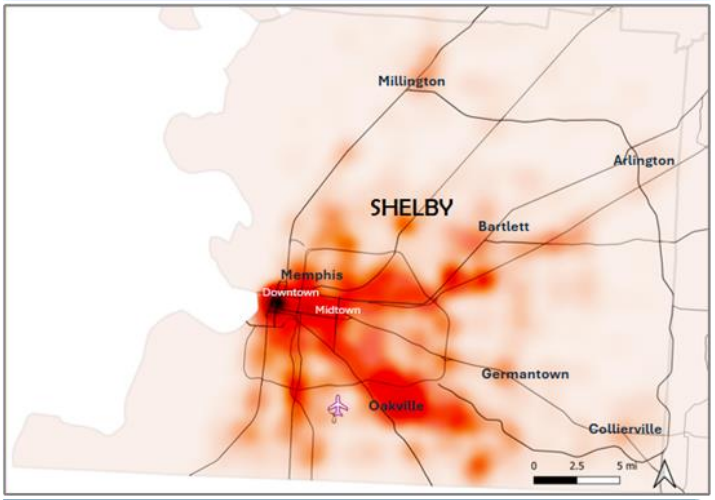
The economic burden of these crashes reached $123.3 billion in 2020.

This project aims to develop a comprehensive risk analysis framework to identify patterns, trends, and high-risk groups associated with alcohol-impaired driving.

Objectives

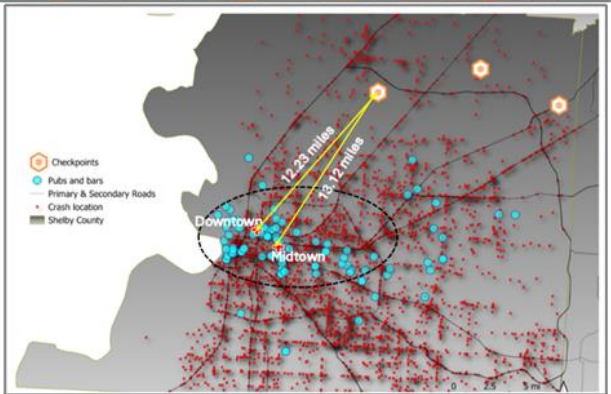
- Analyzing the spatial and temporal patterns of alcohol-impaired crashes
- Understanding the driver behavior using simulator study
- Developing a crash risk analysis tool
- Conducting educational and awareness campaigns on alcohol-impaired driving

Crash hotspots – Spatial Analysis



Driver Simulator study

Crash risk analysis tool - Dashboard

Educational & Awareness Campaign


Key Risk Factors
